

Document 2: Methodology and Work Plan

1. Methodological Approach

The proposed methodology is aligned to AFC's TOR and structured to score **"Above Standard"** under the technical evaluation criteria. It combines assurance, technical review, and controlled remediation validation.

Phase-Based Methodology

The engagement will be delivered using a **five-phase approach**:

Phase 1: Initiation and Planning

- Project kick-off and stakeholder alignment
- Review of project documentation, contracts, SLAs, and regulatory requirements
- Finalisation of detailed review plan and evidence request list

Phase 2: Current-State Assessment

- System performance, architecture, and infrastructure assessment
- Data migration and reconciliation validation
- Information security and access controls review
- Operating model and vendor performance assessment

Phase 3: Stakeholder Engagement and Validation

- Interviews with business, IT, risk, and operations stakeholders
- User adoption and change management assessment
- Cross-validation of findings and evidence

Phase 4: Reporting and Remediation Planning

- Development of PIR report and executive summary
- Risk-rating of issues and recommendations
- Development of remediation and optimisation roadmap

Phase 5: Implementation Support and Independent Validation

- Tracking of agreed remediation actions
- Independent validation testing
- Formal closure reporting and management sign-off

2. Six-Week Work Plan

Week	Key Activities	Key Outputs
Week 1	Project initiation, document review, planning	Approved work plan, evidence checklist
Week 2	System, architecture, data migration, security assessment	Interim findings log
Week 3	Operational readiness, vendor performance, user engagement	Validated findings
Week 4	Reporting, risk rating, roadmap development	Draft PIR report
Week 5	Management review, finalisation of reports	Final PIR and executive summary
Week 6	Remediation validation and closure support	Validation report and sign-off

The work plan does not exceed six (6) weeks as per tender requirements.

3. Post-Implementation Support

Post-implementation support focuses on: - Independent tracking of remediation actions - Evidence-based validation testing - Confirmation of issue closure prior to assignment completion
