

Product-Designer Slice – UX & Interaction Review of the Logic & Data-Migration Plan

Goal – Ensure the migration workflow and the associated “manual-override” UI are intuitive, low-friction, and accessible for operators across banking, telecom, insurance, hospitality and education domains.

User-Goal / Friction / Recommendation

User Goal	Potential Friction	Recommendation (because...)
Configure industry-specific extensions (e.g., add “room-type” for hotels)	Deeply nested settings; users must navigate multiple tabs to locate the right schema field.	Collapse the extension panel into an accordion that reveals only the fields relevant to the selected industry. This reduces decision-overload and keeps the primary screen uncluttered.
Manually override scraper data	Conflict-resolution toggle (“manual > scraper”) is hidden in a secondary modal; users may miss it, causing duplicate records.	Surface a single-click “Override” toggle directly on the record row, with a clear tooltip explaining the precedence rule. Primary action = “Save Override”.
Monitor migration progress	Progress bar shows overall % but not per-industry status; operators cannot quickly spot a stalled telecom feed.	Add a stacked progress bar segmented by industry, each with its own colour and tooltip showing “processed / total”. This gives instant visibility without extra clicks.
Validate migrated data	Validation results appear in a dense table, requiring scrolling to find errors.	Provide an inline error badge on each affected row and a summary panel at the top that lists the number of issues per industry, with a “View Details” link that expands the relevant rows.
Accessibility	Small toggle controls and low-contrast text in the override UI.	Ensure a minimum 4.5:1 contrast ratio, increase hit-target size to ≥ 44 px, and add ARIA labels (e.g., <code>aria-label="Manual override - priority"</code>).

Interaction Flow (Primary Path)

1. **Select Industry** – dropdown at top (single primary action).

2. **View Extension Panel** – accordion auto-opens for chosen industry; user edits fields.
3. **Review Scraper Data** – table rows with “Override” toggle visible.
4. **Save Changes** – single “Save Override” button per row (primary action).
5. **Monitor Migration** – stacked progress bar updates in real time.
6. **Validate** – error badge appears; user clicks “View Details” to resolve.

Unhappy Paths & Mitigations

- **Missing toggle visibility** → fallback to a “Show Override Controls” button that reveals hidden toggles.
- **Validation errors exceed screen space** → provide a paginated “Error Summary” modal with keyboard navigation.
- **Screen-reader users** → all interactive elements include descriptive ARIA labels; focus order follows logical reading sequence.

Accessibility Checklist

- Contrast $\geq 4.5:1$ for all text and UI elements.
- Keyboard-navigable controls with visible focus rings.
- Motion-safe: no auto-playing animations; optional reduced-motion setting.
- Screen-reader labels for toggles, dropdowns, and progress segments.

Rationale – Each recommendation reduces cognitive load, surfaces critical actions, and meets WCAG 2.1 AA standards, ensuring operators can manage multi-industry migrations efficiently.

Evidence: UX review note generated by the system (see security scan output) [7].
