

Bottom line: The organization's GitHub ecosystem centers on a local-first AI workforce orchestration platform supported by contract-driven data readiness pipelines, real-time intelligence-gathering tools, and targeted workforce impact simulators [1][2].

- The flagship private repository, `neuroworks`, serves as a local-first AI workforce platform that orchestrates agents, manages governance, and integrates the data pipeline [1][2].
- Core AI logic and real-time data ingestion are driven by the Python-based `main-brain` repository and the `omnis-signal` suite, which functions as an intelligence data fetcher [1][2].
- Enterprise data integration is standardized through the `AI-DATA-READINESS-SYSTEM-ADRS-` repository, which enforces traceable validation and maps raw data into a canonical model [1][2].
- The `ZivaBasa-MVP` repository provides a specialized workforce intelligence platform designed to predict employment and productivity impacts for banking institutions [1][2].
- The technical stack is heavily dominated by TypeScript and Python, with key proprietary systems like `neuroworks` and `cognify` maintained as private repositories [1][2].
