

Bottom line: The organization's GitHub portfolio consists of 11 repositories focused on local-first AI workforce orchestration, contract-driven data readiness pipelines, and workforce intelligence platforms, with TypeScript and Python serving as the primary development languages [1, 2].

Key points

- **Core AI & Workforce Platforms:** The flagship `neuroworks` repository acts as a private, local-first AI workforce platform integrating agent orchestration, the AI Data Readiness System (ADRS), and an Obsidian second-brain [1].
- **Active Development:** The most recently updated repositories (as of July 21, 2026) are `main-brain`, the core Python-based AI/ML backend, and `ZivaBasa-MVP`, an interactive workforce intelligence prototype for banking transformation [1, 2].
- **Data Readiness & Redesign:** The `AI-DATA-READINESS-SYSTEM-ADRS-` repository provides a contract-driven pipeline to ingest, validate, and publish AI-ready datasets, while `zim-compare-ui-redesign-2-` handles frontend interface updates [1].
- **Utility & Intelligence Tools:** Supporting repositories include `omnis-signal` (and its updated variant) for fetching intelligence data, `ZimVoice` for voice utilities, and `AIIA-Website--Invoice-and-Receipt-Generator` for financial document generation [1, 2].
- **Access & Language Distribution:** The codebase is primarily built on TypeScript and Python, with three repositories (`neuroworks`, `cognify`, and `aiia-intel-competitive-analysis`) kept private to protect proprietary IP [1, 2].
